

Git

Initialise a Git repo

```
git init
```

add files to staging area ready for commit

```
git add <file> or .
```

see what is in staging area ready for commit

```
git status
```

commit files to local repo

```
git commit -m "added python files"
```

push local repo to remote repo

```
git push
```

pull latest changes from remote repo

```
git pull
```

clone repo into a new directory

```
git clone
```

```
git config --global user.name 'Alex'  
git config --global user.email 'a@a.com'
```

ignore a file

```
touch .gitignore  
touch log.txt  
mkdir dir1
```

```
.gitignore  
log.txt  
/dir1  
*.txt
```

branches

```
git branch mybranch  
git checkout mybranch  
touch login.html  
git add .  
git commit -m "login form"  
git checkout master  
git merge mybranch
```

list remote repo

```
git remote
```

add remote repo

```
git remote add origin https://github.....
```

```
git remote
```

```
git push -u origin master
```

local only

```
touch readme.md  
git add .  
git commit -m "added readme"
```

push to remote

```
git push
```

```
git clone https://....
```

```
git pull
```

clone, new branch, pull

```
git clone xxx  
cd xxx  
git checkout -b new_branch  
git branch  
edit files...  
git status  
git add <file> or .  
git commit -m "added feature"  
git push (git push -set-upstream origin new_branch)  
pull request online - make sure to select correct branches
```
